^{Summary}

activity ~~character~~ ^{involve cylindrical elements} ~~are~~ arranged in
in a circle, probably 7 in number, the 6 perimeter are
all the same, but central one evinces a functional
or qualitative difference. These cylindrical elements
are enclosed within a fairly thin metal "Cowlings",
and maybe ^{enveloped} ~~enclosed~~ in insulation & damping
material.

New Summary

A interest is a device/object of many technical characteristics. Device has an overall purpose/mission which accomplished by the interaction of several sub-systems, each of which themselves are made up of smaller elements. Main systems seem to be the following:

- ① Activity Chamber(s) section
- Controlling section
- Monitoring section

Activity section is composed of 6-7 activity chambers, arranged in a circle of one in the middle. Middle one is in some different in function/purpose than the 6 around the outside. OO

Controlling provides overall + individual control for each of the activity chambers, + for the device as a whole. Monitoring sections keep track of involved processes.

Entire device seems to be tumbling, spinning, moving, turning, + @ activity chamber appears to be sliding, + moveable - perhaps able to be slid in or out.
