AB

Sub/2 portion "like" engine or carburetor manifold in shape

input

Sub/2 amount of material introduced control speed + vitality of process

Sub/3 like nuclear reactor + Radioactive fuel introduction except this stuff isn't solid

A2 Bk

Chills

Sub/2 Substance involved is somewhat corrosive or unpleasant/unfriendly to unprotected handling. Noxious. Dangerous. Eats out conduit linings - isotopes/ionizers Affected sub channels so corroded or weakened/worn conduit segments can be replaced

Sub/2 what happens here is we only. Doesn't depend on regular outgo or income external to Shelter. It's "like" a test to see if it really works + if so other similar, though refined + "toughened" facilities - Penetration - will be put a variety of local facilities - Soviet facilities - at any rate devices

AS

54 1/2 externally, not hardly noisy, nor any major heat/light/noise signature to indicate processes being performed inside ~~off~~ Aulage.

may
want to
do w/
radiant heat
"like" an
almost fixed
deployable
nuclear heating
generator

54 1/2 lifespan approx 10 years - periods ("life" 1 1/2 - 2 yrs)
people-vehicle carriers large metal component arrives &
constant interior Aulage + exterior shelter base, rails
simultaneously - some parts for 603 to bring thru
door + must be put in place before shelter completely
unloaded. Testing "Low-load" runs. Sub-climate checks
out over period. "Full runs" going now. Eventually
continued as "research" station for possible future applications

fusion
plant.

54 1/2 Substances involved are recyclable up to a point

Self "Libi" there's two different ~~eq~~ systems that are not in any way physically connected but must be in complete juxtaposition to one another - in direct immediate vicinity & adjacent to each other because they depend on each other to accomplish desired result. But they may not intermix without completely negating project. The one taking and the other have some sort of measurable stimulation input & @ the output actually being in direct contact.
